We appreciate your feedback. Barton The detector can be placed at varying distances from the light source within the tissue [33].

To orient this unambiguously, we shall employ the convention indicated in Fig. 1. For example, absorption can cause heating, which can drive ionization, which changes the tissue optical properties, which can increase the absorption of the incident light and thus further increase the heating, leading to a cascade that can induce plasma formation, eventual pressure rises, and explosive expansion of the material.
