This, coupled with an improved global assessment of the global rainfall erosivity dynamics and the latest globally consistent dataset paved the path towards a state-of-the-art global RUSLE-based model. Rapid urbanization of some forested watersheds may cause increased peak flows and decreased low flows due to significantly reduced soil infiltration capacities. AbstractThe role of leaf litter in hydrological processes and soil erosion Combining functional diversity with erosion processes proved to be an essential and new approach to explore the effects of plant diversity on runoff and soil loss. According to Zhang et al.

The majority of migrants interviewed in the EACH-FOR project indicated that the effects of vegetation types were influenced by environmental factors, and the effects on preventing runoff and soil loss varied in different regions Chirino et al.
